

1.

Issues and areas for discussion include

Introduction	• Definitions of, eg. ◦ monopoly policy ◦ long run ◦ abuse of power.
Developing the response to the question Application/ Analysis	Application • Policy options, eg ◦ ending monopoly (losing advantages as well as disadvantages) ◦ amending monopoly (keep advantages, control disadvantages, through regulation/taxation/other means) ◦ remove barriers to entry or other market imperfections. Analysis • basic criticisms of monopoly (eg efficiency, deadweight losses) • basic defence (eg econs of scale) • basic arguments in favour of competition policy • relevant concepts, producer surplus, consumer surplus • welfare transfers and welfare losses between producers and consumers when monopolies are broken up ◦ without consideration of scale economies ◦ with consideration of scale economies • effects of wider considerations, eg technological change employment, international competition • efficiency concepts: productive, allocative • contestability; • “creative destruction”

Evaluation	• Question of whether breaking up a monopoly leads to 'perfect' competition, or merely replaces a monopoly with an oligopoly. • The role of government, regulators • Occasions where monopoly is arguably in the consumer interest, eg when copyrights, designs, patents, grant a limited monopoly in order to encourage innovators to share their ideas • Occasions when patents etc are used to restrict competition and work against the consumer interest • The greater divisibility of many modern technologies, eg PCs and laptops replacing large business machines. MES moves to the left on a LRAC graph, when there is an absence of indivisibilities • Market forces along with technical change have made computer technology affordable to the masses • Similar experiences with other products, eg audio-visual, phones • Whether the experience of the computer industry is of wider significance in all cases • Question the 'will not last'. Is it the case they can't abuse monopoly power? • Maybe IBM was effectively targeted by anti-monopoly policy • This question is worded to allow high evaluation scores for a focus on examples other than the computer industry. <i>Examiners should note that, for some of the weaker or average candidates, parts of the above represent quite sophisticated evaluation and so it is important to ensure that more basic evaluation is adequately rewarded where a genuine effort has been made to display that skill.</i>
Also give credit for	• Diagrams • An overall judgement on the issues raised. • Examples.

It will only be possible for candidates to consider a few of the above. They may also discuss issues not discussed above.

[25]

The issues identified below are intended to provide an indication of some of the areas which might be discussed. Candidates can only be expected to consider a few of these and/or other issues in the time available.

Issues and areas for discussion include:

Introduction	• definition of monopoly • examples of monopolies • explanation of 'legally backed' monopoly (IPR as an entry barrier) • discussion of the idea of 'public interest'
Developing a response to the question:	• General advantages / justification of monopolies (economies of scale, etc) • IPRs are justified because ◦ They support the creative industries ◦ Reference to economic importance of these industries (Extract C) ◦ Innovation, creativity, dynamic efficiency ◦ Return on risky investment • Arguments against 'stronger action' (general arguments against monopoly applied to the specific case of IPRs), eg ◦ Artificially high prices ◦ Loss of efficiency ◦ Reduced consumer choice
Evaluation:	• role of government / legal sanctions • market failure versus government failure • producer versus consumer sovereignty • alternatives to the legal approach, eg ◦ Regulators ◦ Leave it to market forces ◦ The need for international / global action / agreement <i>Examiners should note that it may be possible to award some marks for basic evaluation such as consideration of a number of pros and cons. However, this must be considered as low-level evaluation and rewarded accordingly. Stronger evaluation would prioritise the arguments for and against, and/or give economic reasons for justifying a particular policy decision.</i>
Also give credit for:	• use of data • relevant use of evidence and examples not contained in the data

- diagrams
- an overall judgement on the issues raised

[25]

Issues and areas for discussion include

Introduction	• Links between the quotation and economic issues that affect firms operating in the SEM, e.g: ◦ Economies of scale ◦ Market size ◦ Market share ◦ Efficiency
Developing the response to the question:	• Benefits to large retailers • Supply side, e.g. ◦ Economies of scale ◦ Specialisation ◦ Diversification ◦ Labour market (a source of willing workers) • Demand side, e.g. ◦ More consumers ◦ Growth opportunities • Costs to large retailers, e.g. ◦ New competitors ◦ Firms ◦ Products ◦ Currency problems (euro against pound) ◦ EU competition regime • Benefits to small firms, e.g. ◦ Internet trading without cross-border restrictions ◦ Specialist 'niche' in the market ◦ Consumers travelling to continental markets ◦ Peripatetic markets visiting UK towns ◦ Cheap labour from Eastern Europe ◦ Examples, e.g. the phenomenon of the Polish grocery shop • Costs to small firms, e.g. ◦ Excessive bureaucracy, e.g. regulations against ugly fruit ◦ Costs of compliance, e.g. metrication of weights and measures • Costs/benefits to consumers, e.g. ◦ Lower prices ◦ Greater choice

	◦ More innovation ◦ Homogenisation of products and retailers ◦ Disappearance of local shops
Evaluation	• discussing whether retailing relates to the single market in the same way as, say, manufacturing • distinguishing between the positions of different types of retailers, e.g. grocers, white goods, clothes • the different impacts on small/ large retailers • the extent to which the interests of consumers and retailers coincide • the possible impact of EU competition policy <i>Examiners should note that it may be possible to award some marks for basic evaluation such as consideration of a number of pros and cons. However, this must be considered as low-level evaluation and rewarded accordingly. Stronger evaluation would prioritise the benefits and costs, and/or give economic reasons for justifying a judgement on, for example whether benefits generally outweigh costs.</i>
Also give credit for:	• relevant use of evidence and examples not contained in the data • diagrams • an overall judgement on the issues raised

[25]

Issues and areas for discussion include

Introduction	• Links between the quotation and economic issues that are contested e.g: ◦ Positive/ negative externalities ◦ Consumer choice/ monopoly power ◦ Food security/ distributive issues
Developing the response to the question	• Arguments for government support of production and use, e.g: ◦ Consumer sovereignty (assuming consumers want them) ◦ Efficiency arguments ◦ The need to feed a rapidly expanding population ◦ The need for technical progress ◦ Alleged external benefits • Arguments against, e.g: ◦ Consumer sovereignty (European consumers appear not to want them) ◦ Market failures such as Environmental damage, Other negative externalities such as damage to organics; health concerns, Monopolistic practices, Asymmetric information ◦ Government failure
Evaluation	• Market failure versus government failure • Consideration of whether consumers/governments/farmers have sufficient information, or whether they are influenced by the media, pressure groups and interested parties (both for and against GM crops) • Very perceptive and aware candidates might discuss whether the word 'support' in the question simply means 'allow' or 'facilitate' or whether there is an argument about actively encouraging GM growers, e.g. through subsidy. • Discussing whether intervention: is likely to correct or reduce any perceived market failure, eg the negative externalities produced by petrol/diesel fuelled cars; might lead to government failure; might increase or reduce economic efficiency; might increase or reduce economic welfare. <i>Examiners should note that it may be possible to award some marks for basic evaluation such as consideration of a number of pros and cons. However, this must be considered as low-level evaluation and rewarded accordingly. Stronger evaluation would prioritise the arguments for and against, and/or give economic reasons for justifying a particular policy decision.</i>

Also give credit for:

- relevant use of evidence and examples not contained in the data
- diagrams
- an overall judgement on the issues raised

It will only be possible for candidates to consider a few of the above. They may also discuss issues not discussed above

[25]

5.

Explanation

- Define productivity/the long run or any other term
- Either define/describe diminishing returns in general terms and/or state the law of diminishing returns, or relate diminishing returns specifically to food production, e.g. by explaining how food output at first rises more than proportionately than inputs, then less than proportionately as the capacity limits of farmland are approached (alternatively they could explain in terms of falling then rising short run average costs).
- Explain that GM crops could increase productivity in the short run, e.g. by arguably 'delaying' diminishing returns by making more intensive use of the fixed factor, land through increasing its productive capacity.
- And/or explain that GM crops could bring economies of scale and provide increasing returns in the long run (alternatively they could explain in terms of falling long run average costs)

[9]

Issues and areas for discussion include:

Introduction	- the meaning of cost minimisation - the meaning of revenue maximisation.
Developing the response to the question:	- methods of reducing / minimising costs - implications of cost minimisation - methods of increasing / maximising revenues - implications of revenue maximisation - discussion of whether both can be pursued at once - profit maximisation / satisficing - other possible objectives; the importance of the type of firm, eg small, large - issues to do with the divorce of ownership and control; different sections / interests within a single firm might have different objectives, eg production process (minimise costs) sales / marketing (maximise total revenue) managers (utility / status / bonuses linked to profits / sales / other indices), shareholders (long-run, short-run perspectives on share prices and dividends).
Evaluation	- consequences of different types of conduct / market structure - explanation that while $\text{Total Profit} = \text{TR} - \text{TC}$, maximum profit is at $\text{MC} = \text{MR}$ and can occur in the short run when revenues are not maximised and costs are not minimised - consideration of short-run and long-run equilibrium - possibility of satisficing and other types of behaviour - picking up on the word 'always' in the question. Examiners should note that it may be possible to award some marks for basic evaluation such as consideration of a number of pros and cons. However, this must be considered as low-level evaluation and rewarded accordingly. Stronger evaluation would prioritise the arguments for and against, and / or give economic reasons for justifying a judgement.
Also give credit for:	- relevant use of evidence and examples not contained in the data - diagrams - an overall judgement on the issues raised

**8.****For candidates who:**

Explain the difference between the short run and long run, eg in terms of a fixed factor of production in the short run and variable productive capacity in the long run; or define terms: diminishing returns, economies of scale.

Explain the relationship between diminishing returns and short run costs, and returns to scale and long run costs (explanation can refer to marginal or average values) eg:

- diminishing returns operate in the short run as successive units of a variable factor are combined with a fixed factor; example given of a fixed factor and variable factor; eventually average / marginal physical output falls and average / marginal costs rise.
- if a production unit operates at a level of output well below capacity then efficiency is low, average costs will be high; as more units of variable factors are used average costs will fall as productive capacity is approached.
- in the long run all factors are variable and the LRAC curve can be falling, horizontal or rising, depending on increasing returns to scale, constant returns to scale, or decreasing returns to scale
- types of scale economies / diseconomies / indivisibilities etc.
- reward a direct discussion of the quote, regarding certainty. For example, if diminishing returns never set in, we could feed the world out of one farmer's field (factors are not perfectly substitutable); in the long run we are looking into the future, which is inherently unpredictable, so scale economies are less certain.

A maximum of **10 marks** for explaining the relationship if reference to either the diminishing returns (short run) or returns to scale (long run) is omitted from this explanation.

[15]

**9.**

The issues identified below are intended to provide an indication of some of the areas which might be discussed. Candidates can only be expected to consider a few of these and/or other issues in the time available.

Issues and areas for discussion include:

Introduction	• distinction between mobility and flexibility • mobility: occupational, geographical • flexibility: hiring and firing, skills, etc.
Developing a response to the question:	• Costs to UK economy, eg ◦ Wages depressed by cheap influx of labour ◦ Shortages re-appear when migrants return home ◦ Loss of spending power when earnings are repatriated • Benefits to UK economy, eg ◦ Better information ◦ Recognition of UK qualifications in EU ◦ Job opportunities in EU for UK workers ◦ Possible harmonisation of working conditions, tax rates, pension rights, health services ◦ Skills gaps filled ◦ Labour shortages alleviated
Evaluation:	• benefits versus costs • discussion of the 'proper' role of government / NHS / other bodies • Consideration of monetary / non-monetary factors (Extract F suggests that a 'scheme' was considered necessary to attract dentists) • complications arising from cross-border movements, eg ◦ 'British jobs for British workers' ◦ Difficulty of long-term stability, when workers can leave as easily as they can arrive ◦ Effects on economic welfare in the countries that dentists / other workers leave (the question is UK centric, but there is such a thing as 'interdependence' – what if other countries respond by trying to 'poach' key UK workers?) • Other considerations ◦ Pressure on housing / schools and benefits ◦ Possible multiplier effects ◦ Implications for government tax revenues ◦ Impact on wage inflation and economic growth

	◦ Significance of 'flexibility' in general. <i>Examiners should note that it may be possible to award some marks for basic evaluation such as consideration of a number of pros and cons. However, this must be considered as lowlevel evaluation and rewarded accordingly. Stronger evaluation would prioritise the benefits and costs, and / or give economic reasons for justifying a judgement on, for example, whether benefits generally outweigh costs, or whether large firms on balance benefit more than small firms.</i>
Also give credit for:	• relevant use of evidence and examples not contained in the data • diagrams • an overall judgement on the issues raised • use of data

[25]

10.

Explain (eg define / describe) how the size of a firm can be measured (eg in terms of capital employed, profits, market share, employment).

Explain the different ways in which a firm can grow, eg

- internal (organic) growth which can arise through, for instance, selling to an expanding market, or achieving greater market share and can be financed through means such as ploughed-back profits or borrowing/leverage
- external growth (mergers / takeovers)
- vertical integration
- horizontal integration
- diversification (lateral / conglomerate integration)

[15]

Issues and areas for discussion include:

Introduction	• Definition/explanation of 'more responsive to market forces' • Basic reasons why governments of developed countries support agriculture.
Developing the response to the question (application)	NOTE: Students are not confined to discussion of direct intervention on farm prices; they can discuss government intervention anywhere along the supply chain (e.g. government attempts to modify the behaviour of supermarkets/powerful buyers), and they could then discuss effects working backwards along the chain to the farm source. • Comments from own economic knowledge or based on the data, eg • S & D theory (elasticities, shifts, potentially unstable prices; price support through quotas shifting S to left) • Possible policies for stabilising prices and incomes ◦ national government: competition policy, regulation ◦ EU level: quotas, intervention buying, buffer stocks ◦ milk as a staple foodstuff, an 'essential' ◦ effects of free trade and globalisation (imports are mentioned in Extract E) ◦ production and productivity (Extract F; further discussion of Extract D) ◦ intensity of production (mentioned in Extract F) ◦ economies of scale (Extract F)
Developing the response to the question (analysis)	• Arguments for markets, eg ◦ rationing/signalling ◦ consumer sovereignty and choice ◦ decentralisation ◦ opportunity costs ◦ efficiency ◦ problems with government failure. • Arguments against, eg ◦ market failure, externalities ◦ need for price and Income stabilisation ◦ imperfect information ◦ influence of supermarkets • changes in demand and supply conditions • globalisation, free trade • need for government to act as a broker between producers and retail sector.

Evaluation	• Market failure versus government failure • Consequences of government involvement (eg costs to the taxpayer) versus consequences of non-involvement (eg costs to the consumer; danger of a break in supply) • Free trade versus protection • Power of the supermarkets/small number of processors • Policy appropriate at national level or EU level? • Difficulties of identifying and acting for public interest/interests of consumers/producers • Unintended consequences, eg effects of quotas; milk as a raw material, impacting on many other industries; environmental side-effects of intensive farming • There is information in the data regarding Spain and UK which appears to indicate that quotas discourage economies of scale, and lifting quotas therefore increases efficiency. <i>Examiners should note that, for some of the weaker or average candidates, parts of the above represent quite sophisticated evaluation and so it is important to ensure that more basic evaluation is adequately rewarded where a genuine effort has been made to display that skill.</i>
Also give credit for	• Diagrams/An overall judgement on the issues raised.

It will only be possible for candidates to consider a few of the above. They may also discuss issues not discussed above.

[25]

12.

Analyse **two** effects of technological change which either increase or reduce barriers, for example:

- an argument to the effect that digital/ virtual products are 'weightless' (this word need not be used) and can be brought to market/ retailed at lower cost than traditional, physical products thus reducing entry barriers, increasing competition.
- economies of scale are less important when small firms can have easy access to mass markets through the internet, thus reducing barriers
- technological change can increase the influence of product differentiation, eg by monopolising a new industry format (Blu-Ray), or building in features to thwart industry-wide standards (mobile phone chargers, printer ink cartridges); all the above increasing barriers
- the question refers to Extract B. However, it is perfectly legitimate for candidates also to refer to Extract C where there is mention of legal barriers. Technology can be used to support these and therefore reinforce barriers to entry and restrict access to products (make them more excludable), eg through encryption (satellite TV). On the other hand, technology can be used (often illegally) to circumvent barriers.

[9]

14.

For relevant definitions, eg

- normal/supernormal profits
- short run/long run

- Barriers to entry are a reason. These can include patents which are relevant to pharmaceuticals; they reduce competition and allow a degree of monopoly preventing prices from falling in the long run and thus maintaining supernormal profits.
- Structure of the industry, product differentiation, imperfect knowledge, technological change collusion, limit pricing etc.

Use of appropriate diagrams to help support explanations, e.g. monopoly and/or perfect competition diagram accompanied by analysis of the effects of entry barriers

[15]

Issues and areas for discussion include

Introduction	• definitions of 'large' and 'small' firms • problems of comparison, e.g. capital intensive and labour intensive firms • definitions of efficiency.
Developing the response to the question: Application / Analysis	• discussion of efficiency • advantages of large firms ◦ internal economies of scale • types • effects on costs • external economies ◦ effects on large and small firms • disadvantages of large firms ◦ diseconomies of scale ◦ X inefficiency (note, this is not actually in the specification) ◦ divorce of ownership and control • less clear objectives • size and market structure • advantages of small firms ◦ impact of technology ◦ divisibilities of capital.
Evaluation	• significance of large firms, eg ◦ output ◦ market share ◦ efficiency, dynamic, static • significance of small firms, eg ◦ employment ◦ entrepreneurship and innovation ◦ niche markets ◦ personal service • effects of changes in markets and technology, eg ◦ divisibilities ◦ internet trading ◦ mass production versus mass customisation; dozens of markets of millions versus millions of markets of dozens. <i>Examiners should note that, for some of the weaker or average</i>

	<i>students, parts of the above represent quite sophisticated evaluation and so it is important to ensure that more basic evaluation is adequately rewarded where a genuine effort has been made to display that skill.</i>
Evaluation	• diagrams • an overall judgement on the issues raised

It will only be possible for students to consider a few of the above. They may also discuss issues not discussed above.

[25]

17.

For relevant definitions / descriptions / distinctions, eg

- short run / long run
- examples of fixed / variable factors
- economies of scale.

Short run, for example, successive units of a variable factor are applied to a fixed factor as optimum capacity limits are approached first marginal returns then average returns diminish. Eventually total returns diminish. Returns are related to costs. Productive efficiency maximised at the point of maximum average physical product or minimum average cost.

Long run, explanation of long run returns / relationship to internal economies of scale. Relationship between long run and short run.

Use of diagrams to help support explanations.

[15]

18.

For relevant definitions, e.g. competition, efficiency

Award one mark for each step in a logical chain of argument up to 15 marks, for example

- Allocative: Perfect competition leads to an efficient allocation of resources. Price = marginal cost so that producers are compensated for the effort of production and consumers receive benefit both of which are reflected in the price. Movement away from this equilibrium rewards one group at the expense of the other.
- Productive efficiency arising out of competition, marginal cost = average cost, average cost minimised

Use of appropriate diagrams to help support explanations, e.g. LR equilibrium under perfect competition, monopoly equilibrium

Maximum of 10 marks if only one of the types of efficiency in the question is considered.

[15]

19.

Explanation:

For a relevant definition/explanation of economies of scale, e.g. a reduction in long-run average costs due to the growth of the firm or industry, internal economies, external economies.

Analysis:

Technical economies, related to the use of large scale machinery, reference to factory ships, more capital intensive, less labour employed problems such as 'hoovering up' the seas.

Other economies, e.g. financial, managerial, risk bearing/marketing etc (note: fishing industry can be interpreted to include markets and processing). Reward EXTERNAL as well as INTERNAL economies.

Make appropriate use of diagrams to support the analysis, e.g. LRAC, minimum efficient scale

[9]

20.

Relevant issues/logical chains of analysis include:

- **relevant definitions** eg infrastructure, investment, product markets, labour markets, general technical
- **explanation** of effects on labour and product markets
- The short run (construction phase) will create a demand for the labour of workers directly involved in making the new railway, and also spin-off jobs in firms supplying components and materials
- In the long run (operational phase) reduced journey times for commuters will increase viable travel-to-work distances However, the increased demand might be London based rather than based in the northern cities, so might increase the north-south labour market divide
- Short run (construction phase) the demand for raw materials, components, rolling stock, etc.
- Long run (operational phase): more efficient HS2 line takes pressure of conventional lines, so all lines help get goods and freight to market, more quickly.
- diagrams to help support explanations, eg supply of and demand for labour, and/or goods and freight.

[15]

Candidates do **NOT** have to discuss the effects of both the size of firms and structure of the market for full marks.

Issues and areas for discussion include

Introduction	Basic definitions/descriptions of ownership, control, structure (eg. competition/monopoly) barriers), conduct (eg pricing behaviour); performance (eg productive/allocative efficiency).
Developing the response to the question Application/ Analysis	Application • Candidates might approach the information in the stem from the angle of perfect/imperfect competition, price taking versus price making, or product differentiation. • They could also elaborate on the possibility of some element of price discrimination taking place here. Analysis • Using the basic information given in the quote, and making reasonable assumptions, candidates can analyse the Cafe scenario. They might also use examples from other industries to support the cafe example. They can comment, for example, on ◦ ownership and control together: profit maximising ◦ divorce of ownership from control: alternative objectives ◦ structure • number of firms • size of firms • entry conditions • location. ◦ Conduct (Behaviour) • pricing taking/price making/price seeking/price leadership (barometric, dominant firm) • ownership/profit maximisation/non-profit objectives • product differentiation/Advertising/Marketing/Brand image-making/Product differentiation • non-price competition (ambience, free wifi etc) ◦ Performance (Efficiency) • productive • allocative • static • dynamic. NOTE: Monopolistic Competition is not on the current specification, but should be credited if used in relevant discussion

Evaluation	• Reasons why ownership and control might be related to structure, conduct and behaviour. • Reasons why size and structure might be closely related to behaviour and efficiency. ◦ eg the assumptions of perfect competition: profit maximising behaviour and price taking, leading to long run equilibrium and productive and allocative efficiency. • The question of whether structure automatically governs behaviour and efficiency. ◦ for example, a group of multinational coffee outlets in a town centre can look monopolistic, but actually behave very competitively, perhaps exhibiting 'price taking' behaviour ◦ possibility of price leadership • following the dominant firm • the small independent firm setting the pace ◦ possibility of collusion PLEASE NOTE: The strongest evaluative answers are likely to discuss the above concepts in the context of the Cafe/Coffee Shop scenario. <i>Examiners should note that, for some of the weaker or average candidates, parts of the above represent quite sophisticated evaluation and so it is important to ensure that more basic evaluation is adequately rewarded where a genuine effort has been made to display that skill.</i>
Also give credit for	• Diagrams • An overall judgement on the issues raised • Examples

It will only be possible for candidates to consider a few of the above. They may also discuss issues not discussed above.

**24.****Relevant issues/logical chains of analysis include:**

- **relevant definitions**, eg monopoly, monopoly power
- **Barriers to entry** affecting the **number of competitors**, these can include legal barriers, such as patents/copyright; set up costs; economies of scale. These barriers might be deliberate, eg supported by government, or might be inherent in the nature of the product or a 'natural monopoly' such as water. Monopolies might be a single firm or created by a 'collusive' or 'complex' monopoly during the production stage or a 'cartel' at the selling stage (1mark). Cartels are generally illegal
- **NOTE:** Several individual **barriers to entry**, for example economies of scale, minimum efficient scale, can be regarded as 'sources' and expanded for further marks.
- **Advertising and product differentiation** aimed at creating real or imagined differences between products through branding and image building, reducing the price elasticity of demand by convincing consumers that products are less homogeneous than they really are
- **Other market imperfections**, eg lack of consumer information, minimum efficient scale, international trade barriers, a break in the chain of substitutes, natural monopoly
- diagrams to support explanations, e.g oligopoly/monopoly/minimum efficient scale (M.E.S.)

[15]**25.****Relevant issues/logical chains of analysis include:**

- relevant definitions, e.g. PED, total revenue, costs, price discrimination
- Price elasticity of demand can change with the time of day eg people on their way to work or on a timed lunch break have fewer alternatives and therefore lower PED. Afternoon customers are under less pressure and so have more alternatives and therefore higher elasticity. The café has large fixed costs, eg staff and therefore there are times of day when it works to full capacity and others where it is under capacity. It therefore needs to spread costs more evenly and then if it can maximise TR it will also maximise profit. Revenue is increased by increasing price when PED is inelastic and reducing price when demand is elastic. In some ways this is a similar pricing strategy to that of the low cost airlines
- This pricing strategy as an example of price discrimination
- Explanation of geometrical relationships on a diagram.
- diagrams to support the explanation, eg AR, MR, MC, price-elastic and inelastic demand.

NOTES: (1) PED, revenues and costs are mentioned in the stem of the question to assist students in focusing their answer. Do not penalise if any of these three items is not specifically discussed. Full marks can be achieved for a clear explanation which does not necessarily discuss all three of these items in any depth, although it can be expected that at least two will be necessary to convey a convincing explanation. **(2)** Scenarios other than the Cafe/Coffee Shop can be credited here if they help the explanation (e.g. on-peak/off peak rail travel can be used in a relevant way)

[15]
