THE GLOBAL CONTEXT

Extract C: Incentives and economic performance

Could inequality be adversely affecting economic performance? According to some economists, capitalism is not working effectively. Reducing trade union power and creating more flexible labour markets have created greater income inequality. Successive governments have also reduced taxation on companies and high earners (such as the cut in income tax for those earning over £150 000 from 50% to 45%) in order to promote incentives and wealth generation, as well as focusing much of the UK's hopes on the financial services industry. These policies, however, have created greater divides in terms of the 'haves' and 'have nots' which may have consequences for the UK's macroeconomic performance. 1

There has been a shift, over the last generation, in the share of GDP from the workforce to shareholders of between 5% –7%, with many low earners finding it difficult to get onto the property ladder. Neo-classical economists cite the trickle-down effect as a way of improving the living standards of all by cutting taxes for upper income groups and business, stating that economic progress depends on saving and innovation which, in turn, depends on the ability to make high profits. However, research by the Tax Justice Network claims that, when there are high levels of inequality, to avoid tax, financial capital often leaves the country, rather than staying in the domestic economy. 5

It has been argued that other policies such as public sector pay rise limits of 1%, benefits rising at 1% rather than inflation-linked increases, and the removal of some housing benefit, as well as the culture of bankers' bonuses, have all contributed to growing inequality. This is likely to have consequences for consumer spending power, but may also help to contribute to reduced inflationary expectations. There has also been criticism of the UK banking system, in that it has been too focused on making quick financial returns rather than long-run investment. Ultimately, these factors may damage the UK's ability to achieve its macroeconomic targets. 10

5.

In May 2014, the European Central Bank (ECB) President, Mario Draghi, warned that there was a risk of deflation across economies in Europe.

Evaluate the view that the UK government should give higher priority to preventing deflation rather than controlling inflation.

13. **THE EUROPEAN UNION CONTEXT**

Extract F: Ireland emerges from bailout

Whilst many of the Eurozone members still face instability in their own economies, Ireland became the first economy to emerge from its bailout since the Eurozone crisis began. In its final report on Ireland's progress under the rescue scheme, the European Commission said: ‘With public sector debt at 122% of GDP in 2013, Ireland needs to continue with its fiscal reduction programmes, reduce private-sector debt and improve bank profitability to revive lending.’	1
Of the UK's top ten European trading partners, Ireland is the only one with which the UK has a current account surplus. The importance of trade with Ireland is therefore of great significance. The Irish and UK economies are highly integrated and it is not yet clear how further cuts in Ireland might impact on the UK's macroeconomic performance.	5
Public sector debt across many European nations is still at very dangerous levels and Ireland's debt to GDP ratio is the second highest in the EU. Higher national debts may lead to problems such as crowding out, where private sector investment is reduced due to increased public sector borrowing. The EU introduced the Stability and Growth Pact (limiting total debt as a percentage of GDP to 60% and annual deficits to 3% of GDP) in order to prevent individual economies from creating instability across the EU. However, EU member countries have struggled to keep to the pact, with only four member countries not breaking the rules. Both Ireland and the UK have breached the pact since 2008. No doubt more problems lie ahead for the Eurozone.	10

**14.****THE EUROPEAN UNION CONTEXT****Extract E: The French economy faces problems**

The International Monetary Fund (IMF) has warned the French government that, unless it makes major economic reforms to lower its labour costs and avoid tax rises, the economy is likely to experience reduced growth. This view was echoed in a recent survey of bankers, in which France was identified as the most serious threat to Europe's recovery from the debt crisis which has crippled growth and driven unemployment to record highs. The outlook for France, the Eurozone's second largest economy, is more worrying than that for Italy, Spain or Germany.	1 5
The Chief Executive officer of the Institute of International Finance said: 'There's a lack of concern about international competitiveness in France.' French President, François Hollande, is failing to revive business investment in the face of one of the world's highest tax burdens. Such investment could generate greater efficiency and higher productivity, especially important if the euro's exchange rate does not always work in France's favour.	10
An IMF spokesperson, Edward Gardner, also said that French unemployment, which currently stands at 11%, would continue to rise, despite President Hollande's vow to reduce it by the end of the year. 'It reflects in large part a general phenomenon in Europe that the recovery is slower in coming than we had expected.' The euro area's recovery almost came to a halt as the French economy unexpectedly shrank and German growth slowed.	15
The failure of the French economy to improve is in contrast to the overall success of the German economy and the stronger signs of recovery in the UK. President Hollande now faces difficult choices in reducing government spending to reach European budget deficit commitments. Furthermore, a recent announcement that VAT will rise, despite previous claims that there would be no significant tax rises, may cause further problems for the economy.	20 25
