5.

The Global Context Extract C (lines 7–9) states: ‘These policies, however, have created greater divides in terms of the ‘haves’ and ‘have nots’ which may have consequences for the UK’s macroeconomic performance.’

Using the data and your knowledge of economics, assess the importance for UK macroeconomic performance of increasing income inequality, **both** domestically **and** in other economies.

[25 marks]

THE GLOBAL CONTEXT

Extract C: Incentives and economic performance

Could inequality be adversely affecting economic performance? According to some economists, capitalism is not working effectively. Reducing trade union power and creating more flexible labour markets have created greater income inequality. Successive governments have also reduced taxation on companies and high earners (such as the cut in income tax for those earning over £150 000 from 50% to 45%) in order to promote incentives and wealth generation, as well as focusing much of the UK's hopes on the financial services industry. These policies, however, have created greater divides in terms of the 'haves' and 'have nots' which may have consequences for the UK's macroeconomic performance.

There has been a shift, over the last generation, in the share of GDP from the workforce to shareholders of between 5% –7%, with many low earners finding it difficult to get onto the property ladder. Neo-classical economists cite the trickle-down effect as a way of improving the living standards of all by cutting taxes for upper income groups and business, stating that economic progress depends on saving and innovation which, in turn, depends on the ability to make high profits. However, research by the Tax Justice Network claims that, when there are high levels of inequality, to avoid tax, financial capital often leaves the country, rather than staying in the domestic economy.

It has been argued that other policies such as public sector pay rise limits of 1%, benefits rising at 1% rather than inflation-linked increases, and the removal of some housing benefit, as well as the culture of bankers' bonuses, have all contributed to growing inequality. This is likely to have consequences for consumer spending power, but may also help to contribute to reduced inflationary expectations. There has also been criticism of the UK banking system, in that it has been too focused on making quick financial returns rather than long-run investment. Ultimately, these factors may damage the UK's ability to achieve its macroeconomic targets.

Extract B: Will growing inequality damage the US economy?

Some economists are predicting that the US will play a leading role in driving world economic growth and, as the country which is the UK's main export partner, this may provide an injection into the UK's circular flow of income. However, since the 2008 financial crash, there has been debate in the US over whether or not economic growth can be strengthened and, if so, how best to achieve this. Within this debate, there are growing concerns about the specific issue of income inequality. The top 1% of earners have received 95% of the increase in income since the financial crisis. Since 2009, the top 1% have seen their incomes rise on average by 31.4%, whereas the rest of the population has seen a rise of only 0.4%. 1

The economist, Joseph Stiglitz, has highlighted inequality as one of the prime reasons why the US has continued to struggle to recover. His basic argument is that the rich have a lower marginal propensity to consume (the proportion of any increase in income spent) and a higher marginal propensity to save (the proportion of any increase in income not spent) than the poor. 5

Such inequality also creates unsustainable 'property-price bubbles' as wealthy individuals increase the demand for property to let out on the rental market which further fuels inflation. Tax receipts, which could be injected into the economy, also end up being reduced, as the rich are able to exploit loopholes to avoid payment of tax. For this reason, Stiglitz argues that it is necessary for the US Government to intervene to deal with inequality. If the incomes of the poor were raised, increased consumption would occur. 10

This argument is refuted by Paul Krugman, who states that there are some European economies with much lower income inequality which are also in a mess. 15

**11.****The National Minimum Wage after 15 years****Extract D: Calls for employers to commit to paying the Living Wage as the pay gap widens**

The TUC, the Archbishop of Canterbury and Boris Johnson, the Mayor of London, are just a few of those who have called on employers to pay their workers a living wage. The Living Wage is defined as 'the wage that can meet the basic needs to maintain a safe, decent standard of living within the community'. The Living Wage differs from the minimum wage in that the latter is set by law and may fail to provide people with enough income to have a reasonable quality of life. It has been claimed that five million people are paid less than the Living Wage, which is estimated at £8.80 an hour in London and £7.65 elsewhere.

Proponents argue that paying the Living Wage means workers can live with dignity and not just exist. By paying the Living Wage, employers can lift their employees out of poverty, debt, and illness, which will improve family life. Employers benefit because it is easier to recruit and retain staff, productivity increases, and there is a reduction in sickness and absenteeism. Government spending on welfare is also reduced. Everyone is a winner.

12.**The National Minimum Wage after 15 years****Extract B: The National Minimum Wage to rise to £6.50 in October 2014**

Will a rise in the National Minimum Wage (NMW) damage the competitiveness of the UK economy? Representatives of businesses in the UK have claimed that the recently announced 3% increase in the National Minimum Wage is 'unwelcome in today's economic climate'. Critics of the increase maintain that 'it is essential that businesses remain competitive and that the above inflation increase in the NMW will add significantly to business costs'. Yet competitiveness is not just about wages, it also, for example, depends on productivity, the exchange rate and innovation.

Source: News Reports accessed May 2104

13.**The National Minimum Wage after 15 years****Extract A: The role of the National Minimum Wage**

The purpose of the NMW is to provide a wage floor, in order to protect low-paid workers against exploitation, without causing job losses. Many economists have been wary of statutory minimum wages: unless they raise the price of labour at the bottom of the wage distribution above what it would otherwise be they are pointless; but if they raise it then the fear is that they will curb demand for labour, and curb it to the particular detriment of the least skilled.

However, others have pointed out that labour markets are not perfectly competitive. There are costs and risks for workers who want to change jobs, and some employers enjoy a degree of monopsony power in local labour markets. As a result workers may be paid at levels below the market-clearing rate. The implication is that a statutory wage floor may raise the pay of the lowest earners without adverse employment effects. The challenge is to set the level as high as possible short of causing people to lose jobs.

15. Many people were surprised when UK unemployment fell during 2013. The government's policy of deficit reduction was expected to prevent significant falls in unemployment and some called for the government to reverse its policy of planned cuts in expenditure.

Evaluate the view that a policy of budget deficit reduction will make it harder to reduce unemployment further.

[25 marks]

16. Many people were surprised when UK unemployment fell during 2013. The government's policy of deficit reduction was expected to prevent significant falls in unemployment and some called for the government to reverse its policy of planned cuts in expenditure.

Explain why low unemployment is a key objective of economic policy for the UK and most other governments.

[15 marks]

17. In May 2014, the European Central Bank (ECB) President, Mario Draghi, warned that there was a risk of deflation across economies in Europe.

Evaluate the view that the UK government should give higher priority to preventing deflation rather than controlling inflation.

[25 marks]

18. The data below shows economic growth rates, unemployment rates and inflation rates for an economy.

Year	Real output growth rate (%)	Unemployment rate (%)	Inflation rate (%)
2010	2	4	6
2011	3	3	5
2012	4	3	4
2013	5	2	3

All other things being equal, which one of the following is the most likely explanation for the relationship between the rates of growth of real output, rates of unemployment and inflation between 2010 and 2013?

- A A decrease in the money supply. ☐
- B An increase in innovation and productivity. ☐
- C A decrease in the savings ratio. ☐
- D An increase in the current account deficit. ☐

19.

The Balance of Payments Extract F (lines 21–22) states: ‘The UK’s large current account deficit cannot be ignored easily, and research shows that such deficits are reduced eventually through some combination of slower growth and currency depreciation’.

Using the data in the extracts and your knowledge of economics, evaluate the significance of a large and persistent deficit on the current account of the balance of payments for the UK economy.

[25 marks]

20.

The Balance of Payments

Extract F: Warning on UK’s current account deficit

The UK is one of only eight countries to see its current account deficit increase since 2008, and its deficit has increased the most. Should overseas investors be worried? The UK has lived with large current account deficits for decades. From the 1940s to the early 1970s, when the country was operating a fixed exchange rate system, the UK was forced to use contractionary policies to keep the balance of payments in check and had to devalue the pound sterling in 1949 and 1967. From the 1980s onward, with the exchange rate floating, persistent current account deficits stopped being a cause for concern.

In the boom years before the global financial crisis, the current account deficit remained large, exceeding 3% of GDP in 2006. With hindsight, this should have rung alarm bells that the economy had become seriously unbalanced, with foreign money flowing into the UK to fund unsustainable public and private sector consumption rather than investment. After the crash, it was widely assumed that the UK economy would recover through higher exports and higher business investment. Indeed, the government’s 2010 budget forecasted a current account surplus of 0.9% in 2013, driven by a surge in exports. This forecast proved highly inaccurate as the current account deficit increased.

Although surveys show that business confidence is high, investment fell in the year to the end of September 2013, and the UK’s export performance has been poor, despite the depreciation of sterling by approximately 25% in the immediate aftermath of the financial crisis. In contrast, other European economies have seen strong export growth.

The UK’s large current account deficit cannot be ignored easily, and research shows that such deficits are reduced eventually through some combination of slower growth and currency depreciation.

21.

The diagram below shows aggregate demand (AD), short-run aggregate supply (SRAS) and long-run aggregate supply (LRAS) curves for the UK economy. Initial aggregate demand is AD_1 . The shift of the aggregate demand curve to AD_2 is the result of a decrease in bank lending following the 2008–2009 financial crisis.

The shift in the AD curve indicates that the effect of the financial crisis on the UK economy was to create a

- A negative output gap and structural unemployment. ☐
- B positive output gap and cyclical unemployment. ☐
- C positive output gap and structural unemployment. ☐
- D negative output gap and cyclical unemployment. ☐

29.

Government policy

Extract F: Austerity remains

The Chancellor, George Osborne, has ruled out the possibility that the UK's improving economy will lead to immediate tax cuts or spending increases when he said reducing the budget deficit would be the priority of his Autumn Statement. The Chancellor said that the UK was still borrowing too much and that any increase in tax revenues generated from faster growth would be used to reduce the budget deficit and the national debt. 1

The move comes as no surprise, with the Chancellor stating, "I would just remind everyone that I still sit down at the table at the G20 with one of the highest budget deficits. The UK still continues to have some very serious public finance challenges that need to be addressed." 5

This week, the IMF revised up its forecasts for UK growth in both 2013 and 2014, six months after its chief economist, Olivier Blanchard, warned Osborne that he might cause more damage with his austerity plan. However, Osborne responded, "We have a clear plan and we are sticking to that plan." 10

The Chancellor's announcement may not be good for UK firms. It is common for business investment to lead the way when emerging from recession, but not this time. Investment forecasts are being revised downward and, on top of speculation of interest rate rises and criticism of the UK's quantitative easing programme, the outlook is not as good as forecasts first indicated. 15

In explaining its forecast downgrades for net investment over the last three years, the Office for Budget Responsibility (OBR) cites two main factors. Firstly, problems in credit markets have made it difficult for firms to borrow to invest. This may have particularly affected small and medium-sized firms that tend to be more reliant on bank financing. This will only be made worse if interest rates rise. Secondly, the uncertainty generated by the eurozone crisis and other events has stifled investment. 20
